Problem Challenge 2: Maximum CPU Load (hard)

Problem Statement

We are given a list of Jobs. Each job has a Start time, an End time, and a CPU load when it is running. Our goal is to find the **maximum CPU load** at any time if all the **jobs are running on the same machine.**

Example 1:

```
Jobs: [[1,4,3], [2,5,4], [7,9,6]]
Output: 7
Explanation: Since [1,4,3] and [2,5,4] overlap, their maximum CPU load (3+4=7) will
be when both the jobs are running at the same time i.e., during the time interval
(2,4).
```

Example 2:

```
Jobs: [[6,7,10], [2,4,11], [8,12,15]]
Output: 15
Explanation: None of the jobs overlap, therefore we will take the maximum load of
any job which is 15.
```

Example 3:

```
Jobs: [[1,4,2], [2,4,1], [3,6,5]]
Output: 8
Explanation: Maximum CPU load will be 8 as all jobs overlap during the time
interval [3,4].
```

Try it yourself

Try solving this question here:

Java

```
import java.util.*;

/*class Job {
  int start;
  int end;
  int cpuLoad;

  public Job(int start, int end, int cpuLoad) {
```

```
10        this.end = end;
11        this.cpuLoad = cpuLoad;
12      }
13    };*/
14
15    class Solution {
16
17      public int findMaxCPULoad(List<Job> jobs) {
18        int maxCPULoad = 0;
19        // TODO: Write your code here
20        return maxCPULoad;
21      }
22
23    }
```

Test Case | Run Code Result | Stdout

```
[[1, 4, 3], [2, 5, 4], [7, 9, 6]]
```

Use Example Testcases | Run | Submit
