Find the Index of the First Occurrence in a String (easy)

Problem Statement

Given two strings `str1` and `str2`, return the index of first occurrences of the `str2` string in `str1`. If `str2` doesn't exists in `str1` string, return `-1`.

Examples

- **Example 1**:
  - Input: `str1 = "algorithms", str2 = "rith"`
  - Expected Output: `4`
  - Justification: The substring `"rith"` begins at index **4** in the string `"algorithms"`.
- **Example 2**:
  - Input: `str1 = "openai", str2 = "ai"`
  - Expected Output: `4`
  - Justification: The substring `"ai"` starts at index **4** in the string `"openai"`.
- **Example 3**:
  - Input: `str1 = "challenge", str2 = "test"`
  - Expected Output: `-1`
  - Justification: The substring `"test"` does not appear in the string `"challenge"`, hence the output is **-1**.

Try it yourself

Try solving this question here:

Java

```java
public class Solution {
    // Method to find the first occurrence of str2 in str1
    public int findFirstOccurrence(String str1, String str2) {
        // ToDO: Write Your Code Here.
        return -1; // Return -1 if no match is found
```

```
6         }
7     }
8
```

Test Case | Run Code Result | Stdout

```
"algorithms"
"rith"
```

Use Example Testcases | Run | Submit
