Remove K Digits (hard)

Problem Statement

Given a non-negative integer represented as a string `num` and an integer `k`, delete `k` digits from `num` to obtain the smallest possible integer. Return this minimum possible integer as a string.

Examples

1.
   - Input: `num = "1432219", k = 3`
   - Output: `"1219"`
   - Explanation: The digits removed are 4, 3, and 2 forming the new number 1219 which is the smallest.

2.
   - Input: `num = "10200", k = 1`
   - Output: `"200"`
   - Explanation: Removing the leading 1 forms the smallest number 200.

3.
   - Input: `num = "1901042", k = 4`
   - Output: `"2"`
   - Explanation: Removing 1, 9, 1, and 4 forms the number 2 which is the smallest possible.

Try it yourself

Try solving this question here:

Java

```java
import java.util.Stack;

class Solution {
    public String removeKdigits(String num, int k) {
        // TODO: Write your code here
        return "";
    }
}

```

Test Case | Run Code Result | Stdout

"1432219"
3

Use Example Testcases | Run | Submit
