Remove Nth Node From End of List (Medium)

Problem Statement

Given a linked list, remove the last `nth` node from the end of the list and return the head of the modified list.

Example 1:

- **Input**: list = 1 -> 2 -> 3 -> 4 -> 5, n = 2
- **Expected Output**: 1 -> 2 -> 3 -> 5
- **Justification**: The 2nd node from the end is "4", so after removing it, the list becomes [1,2,3,5].

Example 2:

- **Input**: list = 10 -> 20 -> 30 -> 40, n = 4
- **Expected Output**: 20 -> 30 -> 40
- **Justification**: The 4th node from the end is "10", so after removing it, the list becomes [20,30,40].

Example 3:

- **Input**: list = 7 -> 14 -> 21 -> 28 -> 35, n = 3
- **Expected Output**: 7 -> 14 -> 28 -> 35
- **Justification**: The 3rd node from the end is "21", so after removing it, the list becomes [7,14,28,35].

Try it yourself

Try solving this question here:

Java

```java
// class ListNode {
//     int value = 0;
//     ListNode next;

//     ListNode(int value) {
//         this.value = value;
//         next = null;
//     }
// }

public class Solution {
    public static ListNode removeNth(ListNode head, int n) {
        ListNode dummy = null;
        // TODO: Write your code here
        return dummy;
    }
}

```

Test Case | Run Code Result | Stdout

```
[1,2,3,4,5]
2
```

Use Example Testcases | Run | Submit
