Remove Nodes From Linked List (easy)

Problem Statement

Given the head node of a singly linked list, modify the list such that any node that has a node with a greater value to its right gets removed. The function should return the head of the modified list.

Examples:

1. Input: 5 -> 3 -> 7 -> 4 -> 2 -> 1
   Output: 7 -> 4 -> 2 -> 1
   Explanation: 5 and 3 are removed as they have nodes with larger values to their right.

2. Input: 1 -> 2 -> 3 -> 4 -> 5
   Output: 5
   Explanation: 1, 2, 3, and 4 are removed as they have nodes with larger values to their right.

3. Input: 5 -> 4 -> 3 -> 2 -> 1
   Output: 5 -> 4 -> 3 -> 2 -> 1
   Explanation: None of the nodes are removed as none of them have nodes with larger values to their right.

Try it yourself

Try solving this question here:

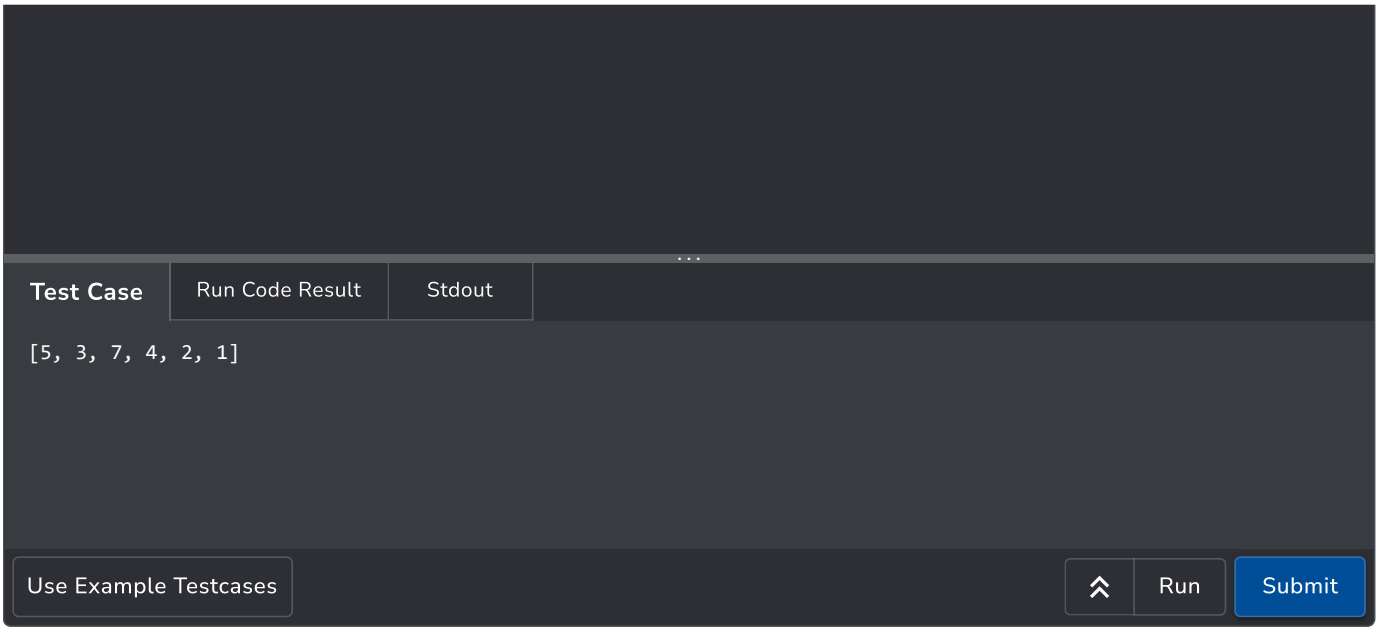

Java

```
import java.util.Stack;

/*class ListNode {
    int val;
    ListNode next;
    ListNode(int val) { this.val = val; }
}*/

class Solution {
    public ListNode removeNodes(ListNode head) {
        // TODO: Write your code here
        return head;
    }
}

```
