Sort Characters By Frequency (easy)

Problem Statement

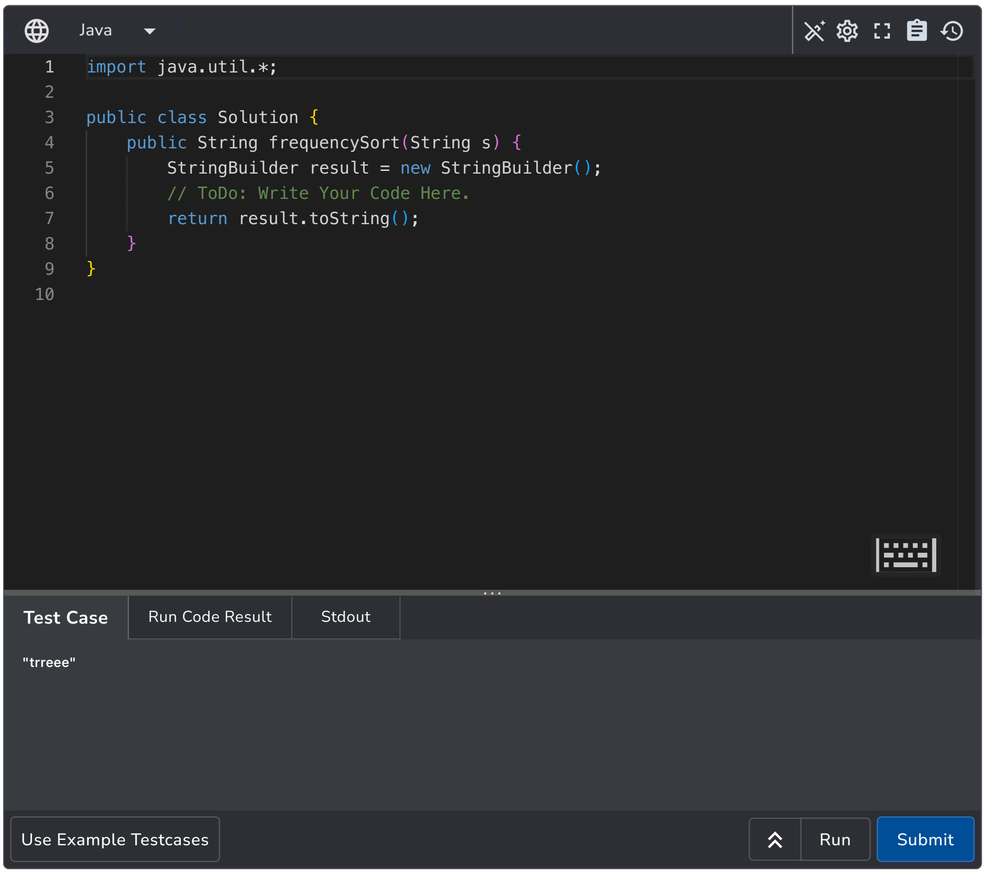

Given a string, arrange its characters in descending order based on the frequency of each character. If two characters have the same frequency, their relative order in the output string can be arbitrary.

Example

1. **Input**: "apple"
   - **Expected Output**: "ppale" or "ppela"
   - **Justification**: The character 'p' appears twice, while 'a', 'l', and 'e' each appear once. Thus, 'p' should appear before the other characters in the output.
2. **Input**: "banana"
   - **Expected Output**: "aaannb".
   - **Justification**: The character 'a' appears three times, 'n' twice and 'b' once.
3. **Input**: "aabb"
   - **Expected Output**: "aabb" or "bbaa"
   - **Justification**: Both 'a' and 'b' appear twice, so they can appear in any order in the output.
