Next Greater Element (easy)

Problem Statement

Given two integer arrays `nums1` and `nums2`, return an array `answer` such that `answer[i]` is the next greater number for every `nums1[i]` in `nums2`. The next greater element for an element `x` is the first element to the right of `x` that is greater than `x`. If there is no greater number, output `-1` for that number.

The numbers in `nums1` are all present in `nums2` and `nums2` is a permutation of `nums1`.

Examples

1. - Input: `nums1 = [4,2,6]`, `nums2 = [6,2,4,5,3,7]`
   - Output: `[5,4,7]`
   - Explanation: The next greater number for 4 is 5, for 2 is 4, and for 6 is 7 in `nums2`.
2. - Input: `nums1 = [9,7,1]`, `nums2 = [1,7,9,5,4,3]`
   - Output: `[-1,9,7]`
   - Explanation: The next greater number for 9 does not exist, for 7 is 9, and for 1 is 7 in `nums2`.
3. - Input: `nums1 = [5,12,3]`, `nums2 = [12,3,5,4,10,15]`
   - Output: `[10,15,5]`
   - Explanation: The next greater number for 5 is 10, for 12 is 15, and for 3 is 5 in `nums2`.

Try it yourself

Try solving this question here:

Java

```java
import java.util.HashMap;
import java.util.Stack;

public class Solution {
    public int[] nextGreaterElement(int[] nums1, int[] nums2) {
            // TODO: Write your code here
        return nums1;
    }
}

```

Test Case | Run Code Result | Stdout

```
[4,2,6]
[6,2,4,5,3,7]
```

Use Example Testcases | Run | Submit
