Number of Islands (easy)

Problem Statement

Given a 2D array (i.e., a matrix) containing only 1s (land) and 0s (water), count the number of islands in it.

An **island** is a connected set of 1s (land) and is surrounded by either an edge or 0s (water). Each cell is considered connected to other cells horizontally or vertically (not diagonally).

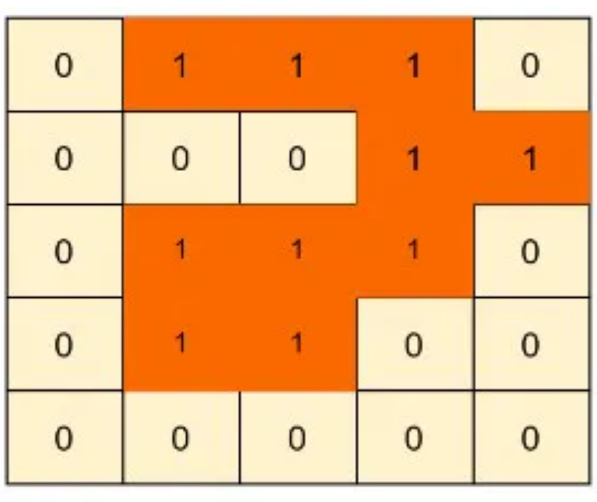
Example 1

Input: matrix =

0	1	1	1	0
0	0	0	1	1
0	1	1	1	0
0	1	1	0	0
0	0	0	0	0

Output: 1

Explanation: The matrix has only one island. See the highlighted cells below.



0	1	1	1	0
0	0	0	1	1
0	1	1	1	0
0	1	1	0	0
0	0	0	0	0

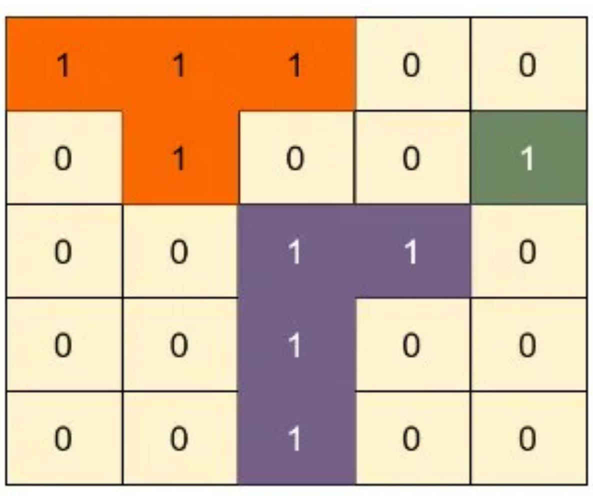
Example 2

Input: matrix =

1	1	1	0	0
0	1	0	0	1
0	0	1	1	0
0	0	1	0	0
0	0	1	0	0

Output: 3

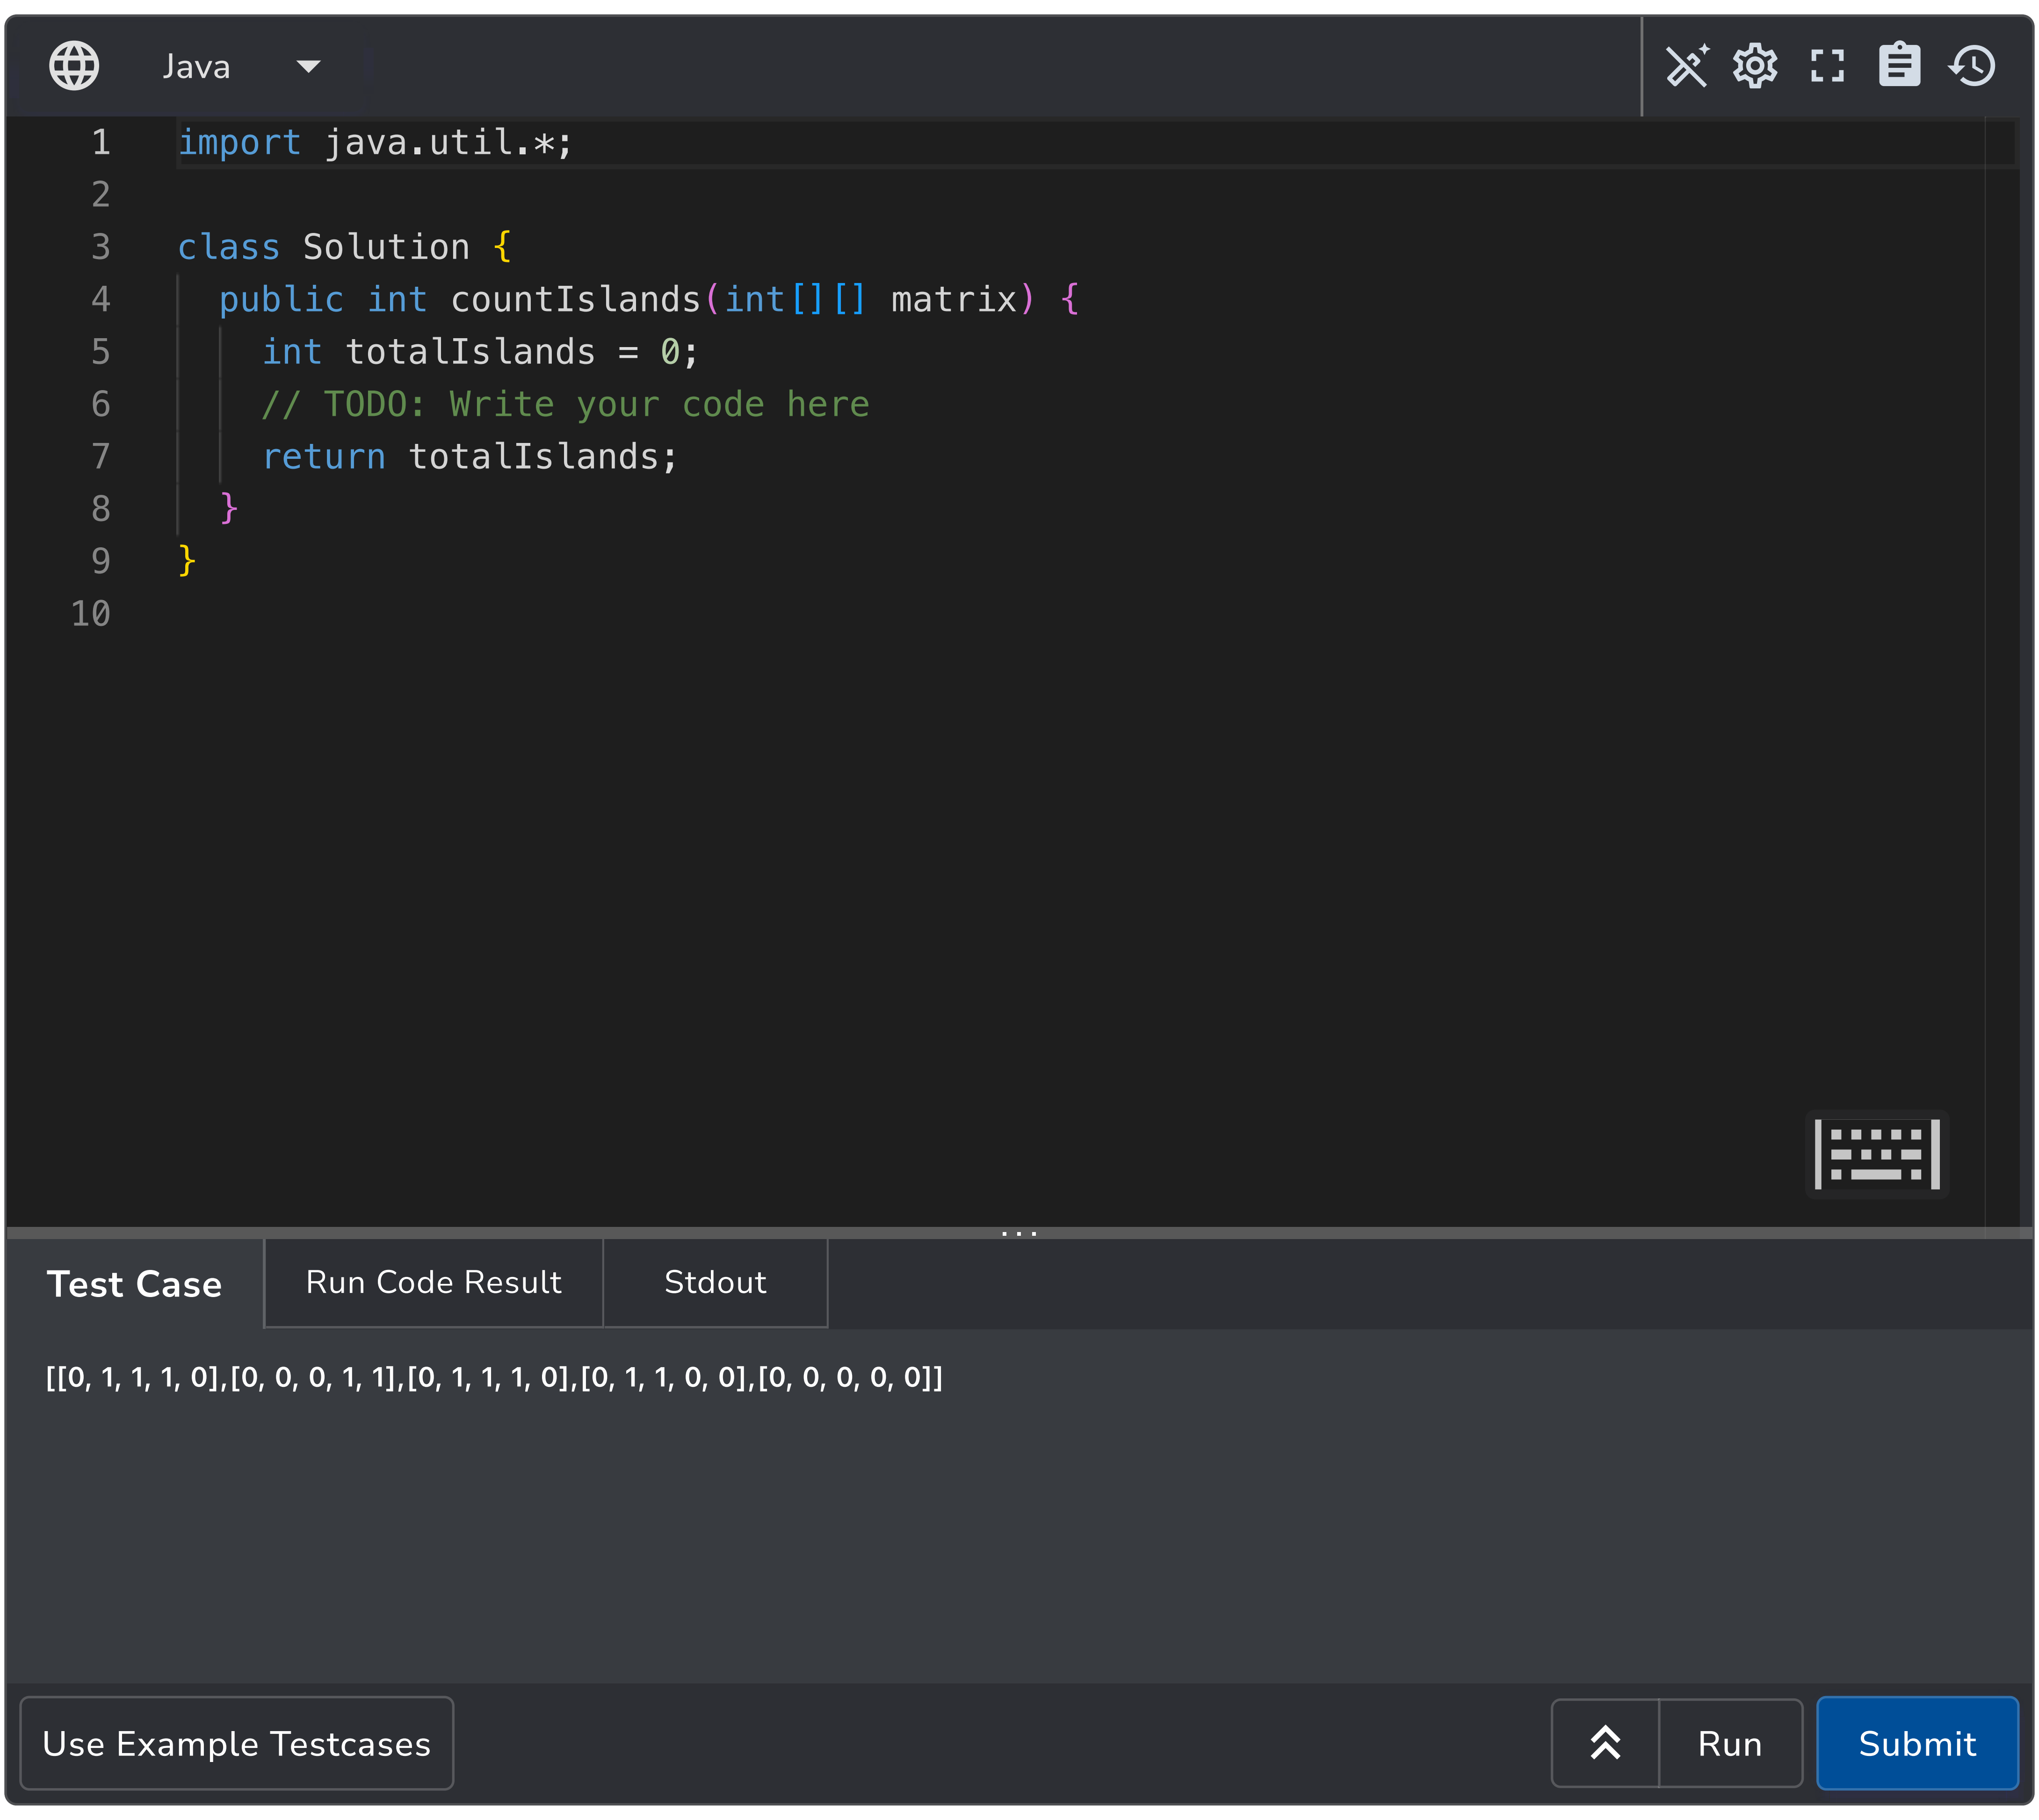
Explanation: The matrix has three islands. See the highlighted cells below.



1	1	1	0	0
0	1	0	0	1
0	0	1	1	0
0	0	1	0	0
0	0	1	0	0

Try it yourself

Try solving this question here:



```java
import java.util.*;

class Solution {
  public int countIslands(int[][] matrix) {
    int totalIslands = 0;
    // TODO: Write your code here
    return totalIslands;
  }
}
```

[[0, 1, 1, 1, 0],[0, 0, 0, 1, 1],[0, 1, 1, 1, 0],[0, 1, 1, 0, 0],[0, 0, 0, 0, 0]]
