Index Pairs of a String (easy)

Problem Statement

Given a string `text` and a list of strings `words`, identify all `[i, j]` index pairs such that the substring `text[i...j]` is in words.

These index pairs should be returned in ascending order, first by the start index, then by the end index. Find every occurrence of each word within the `text`, ensuring that overlapping occurrences are also identified.

Examples

1.
   - **Input**: text = `"bluebirdskyscraper"`, words = `["blue", "bird", "sky"]`
   - **Expected Output**: `[[0, 3], [4, 7], [8, 10]]`
   - **Justification**: The word "blue" is found from index 0 to 3, "bird" from 4 to 7, and "sky" from 8 to 10 in the string.
2.
   - **Input**: text = `"programmingisfun"`, words = `["pro", "is", "fun", "gram"]`
   - **Expected Output**: `[[0, 2], [3, 6], [11, 12], [13, 15]]`
   - **Justification**: "pro" is found from 0 to 2, "gram" from 3 to 6, "is" from 11 to 12, and "fun" from 13 to 15.
3.
   - **Input**: text = `"interstellar"`, words = `["stellar", "star", "inter"]`
   - **Expected Output**: `[[0, 4], [5, 11]]`
   - **Justification**: "inter" is found from 0 to 4, and "stellar" from 5 to 11. "star" is not found.

Try it yourself

Try solving this question here:

Java

```java
import java.util.ArrayList;
import java.util.Arrays;
import java.util.List;

// class TrieNode {
//     TrieNode[] children = new TrieNode[26]; // Array to hold child nodes for each let
//     boolean isEnd = false; // Flag to mark the end of a word
// }

public class Solution {
    public List<List<Integer>> indexPairs(String text, List<String> words) {
        List<List<Integer>> result = new ArrayList<>();
        // ToDo: Write Your Code Here.
        return result; // Return a list of lists containing index pairs
    }
}
```

Test Case | Run Code Result | Stdout

```
"bluebirdskyscraper"
["blue", "bird", "sky"]
```

Use Example Testcases | Run | Submit
