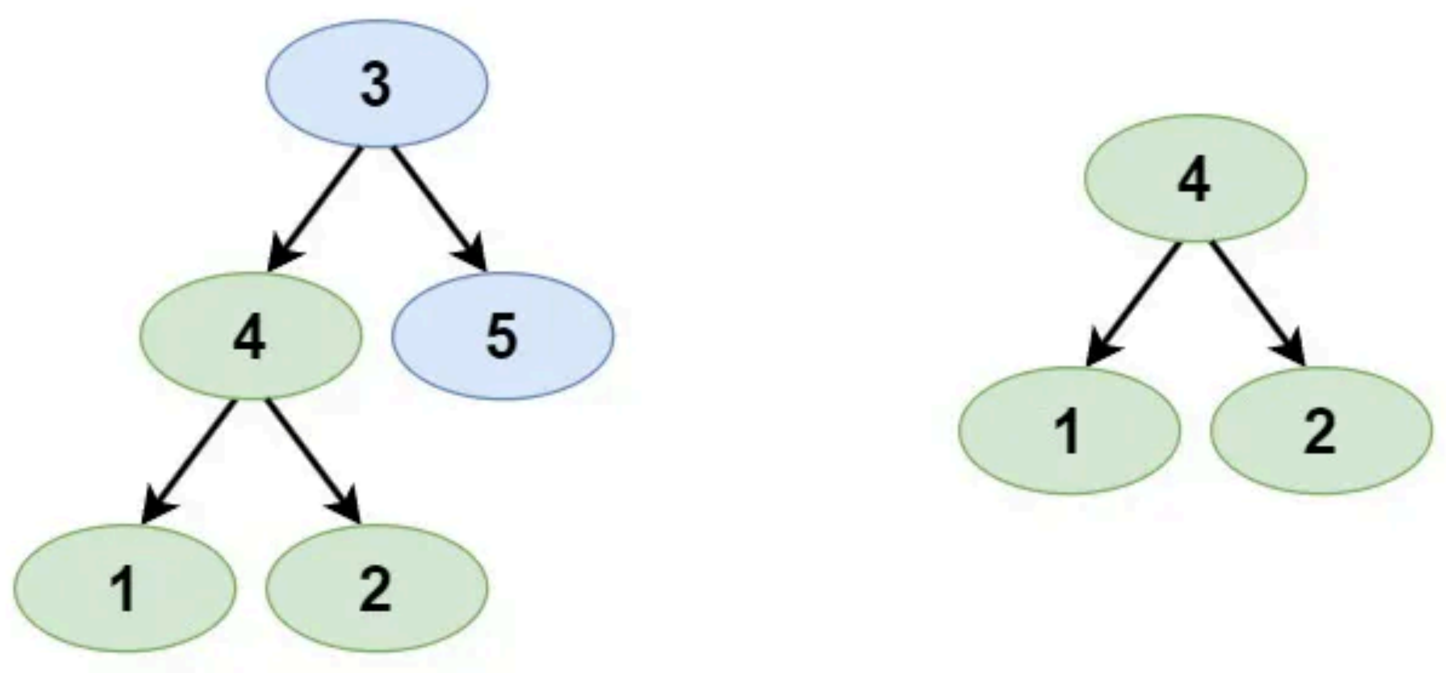
Subtree of Another Tree (easy)

Problem Statement

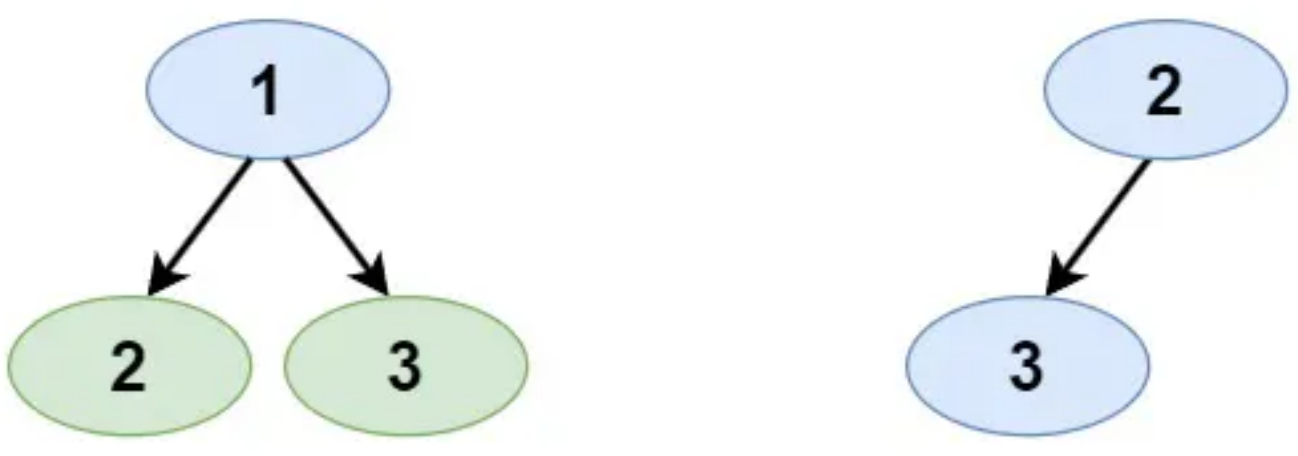
Given two binary trees `s` and `t`, determine if tree `t` is a subtree of tree `s`. A tree `t` is considered a subtree of `s` if there exists a node in `s` such that the subtree of that node is identical to `t`. Both trees are considered identical if their structure and nodes are the same.

Examples

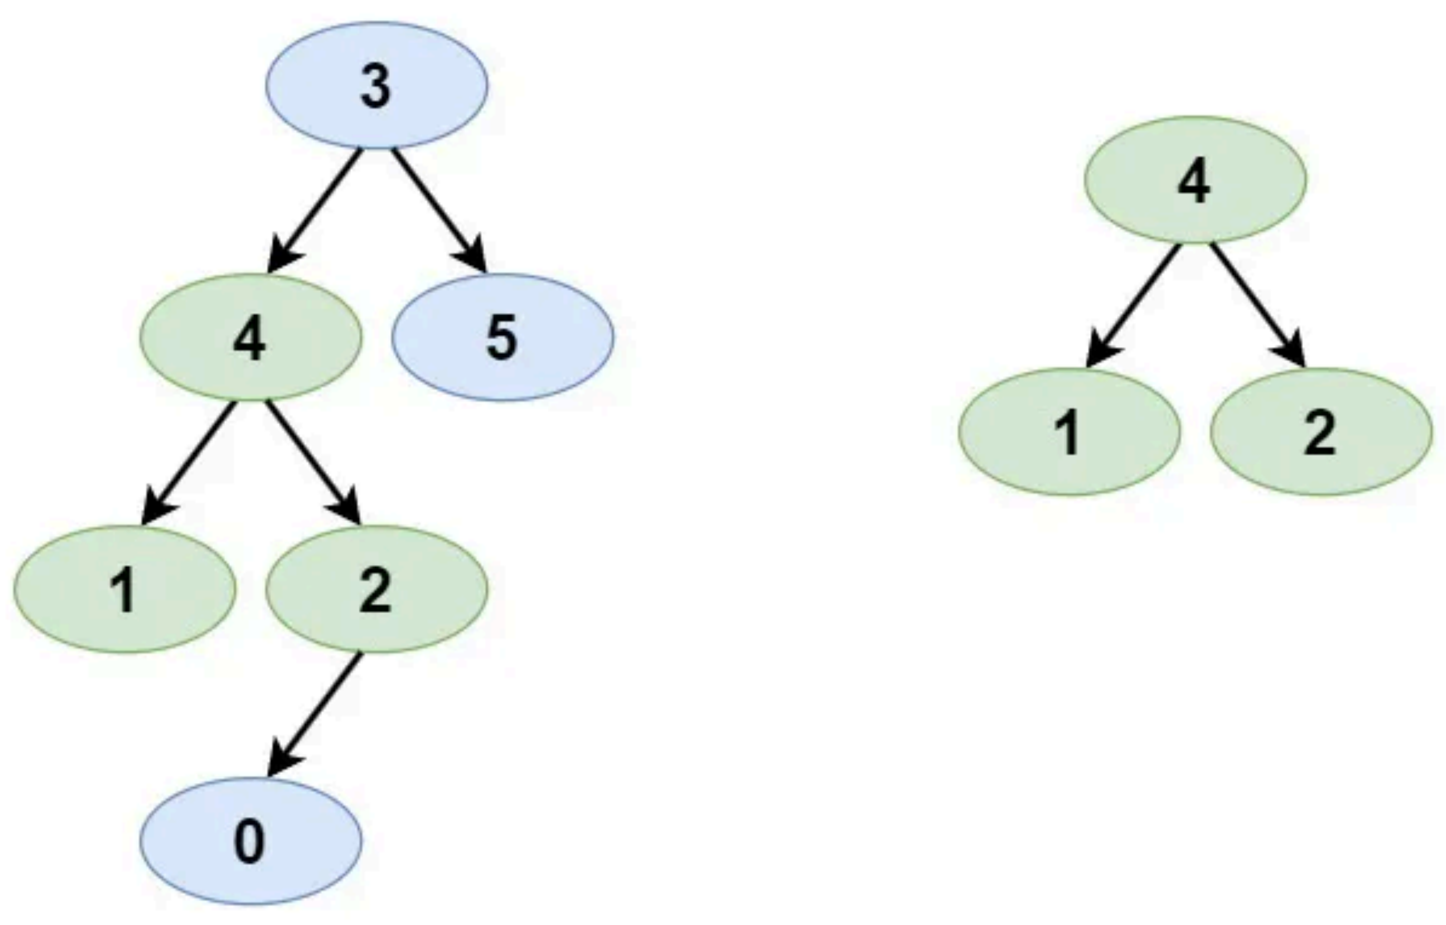
1. - **Input**:
     - Tree `s`: [3,4,5,1,2]
     - Tree `t`: [4,1,2]
   - **Expected Output**: true
   - **Justification**: Tree `t` can be found as a subtree of `s` rooted at the node with value 4.



2. - **Input**:
     - Tree `s`: [1,2,3]
     - Tree `t`: [2,3]
   - **Expected Output**: false
   - **Justification**: There's no subtree in `s` that looks like tree `t`.

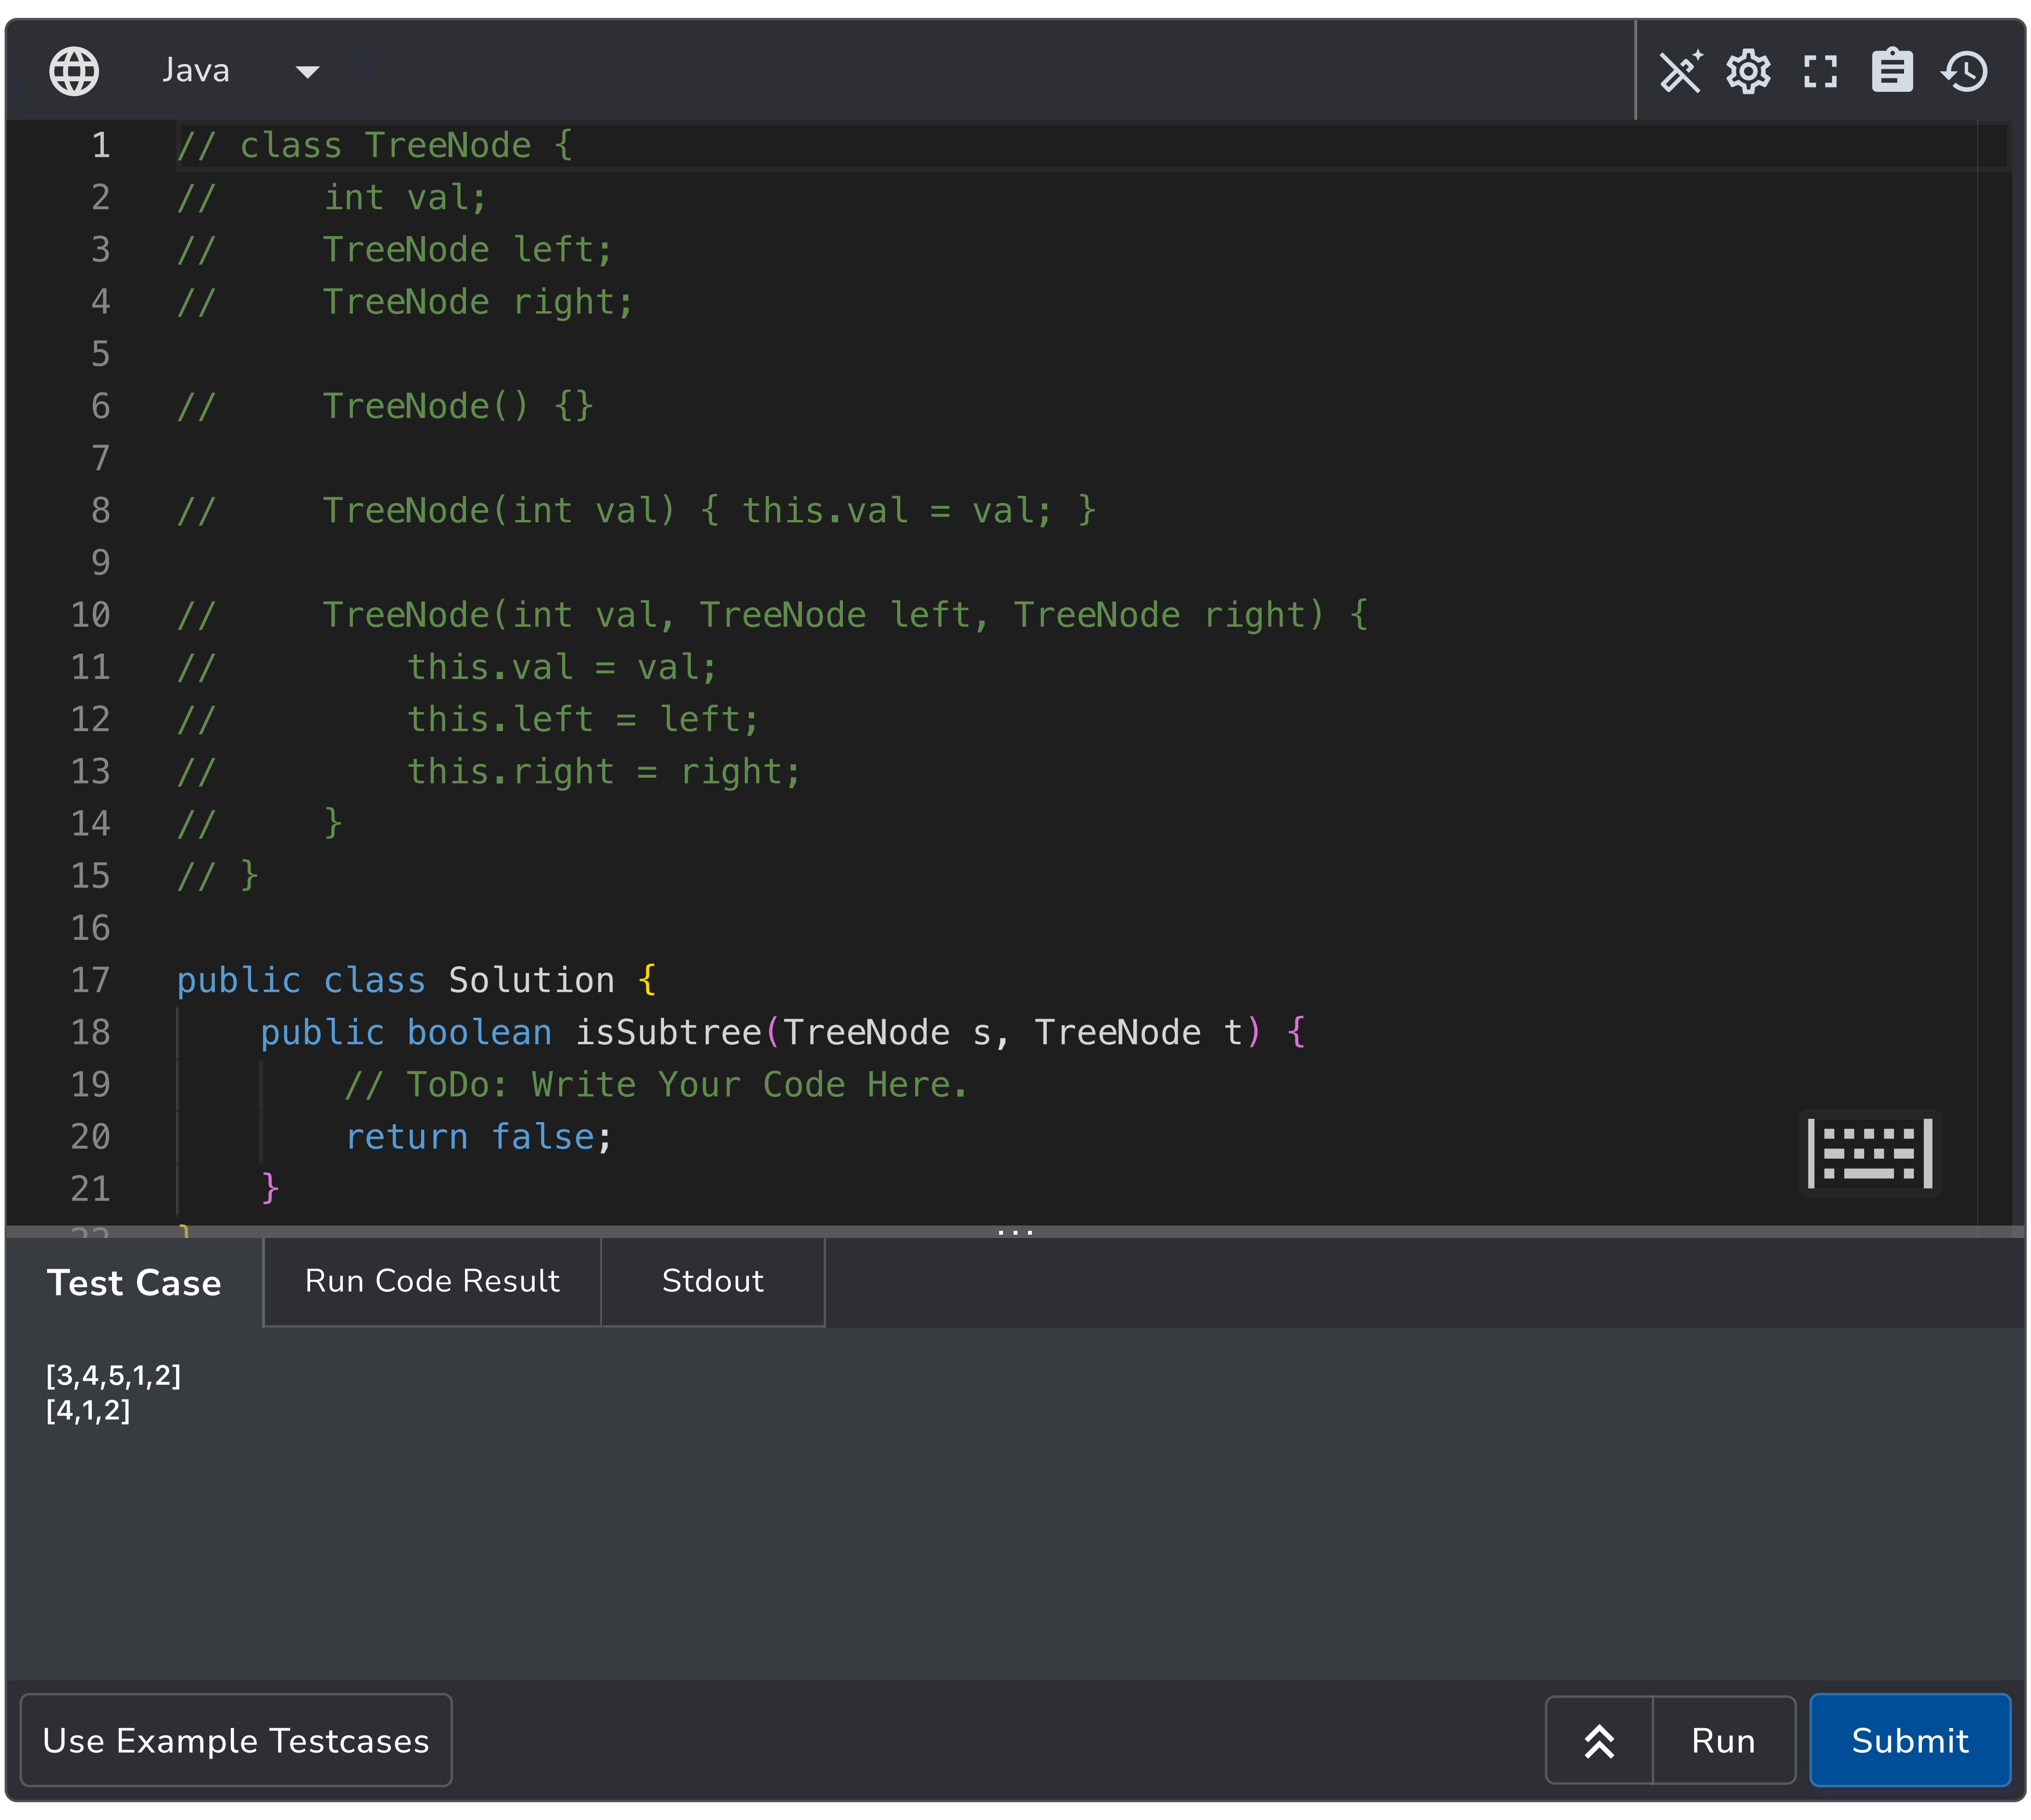


3. - **Input**:
     - Tree `s`: [3,4,5,1,2,null,null,null,null,0]
     - Tree `t`: [4,1,2]
   - **Expected Output**: false
   - **Justification**: Even though there's a subtree with root 4, it's not identical to tree `t`.



Try it yourself

Try solving this question here:



```java
// class TreeNode {
//     int val;
//     TreeNode left;
//     TreeNode right;

//     TreeNode() {}

//     TreeNode(int val) { this.val = val; }

//     TreeNode(int val, TreeNode left, TreeNode right) {
//         this.val = val;
//         this.left = left;
//         this.right = right;
//     }
// }

public class Solution {
    public boolean isSubtree(TreeNode s, TreeNode t) {
        // ToDo: Write Your Code Here.
        return false;
    }
```

```
[3,4,5,1,2]
[4,1,2]
```
