Classification of Design Patterns

As mentioned in the previous chapter, design patterns are typically divided into three categories:

1. **Creational Patterns:** Concerned with the way of creating objects.
2. **Structural Patterns:** Deal with object composition and typically identify simple ways to realize relationships between entities.
3. **Behavioral Patterns:** Concerned with effective communication and the assignment of responsibilities between objects.

The flowchart below visually outlines a decision-making process for selecting design patterns such as Factory, Abstract Factory, Singleton, Prototype, Adapter, Composite, Proxy, and others. The chart begins with a central decision point and branches out based on certain criteria, leading to the selection of an appropriate design pattern.

How to choose a design pattern?
