Subtree of Another Tree (easy)

Problem Statement

Given two binary trees `s` and `t`, determine if tree `t` is a subtree of tree `s`. A tree `t` is considered a subtree of `s` if there exists a node in `s` such that the subtree of that node is identical to `t`. Both trees are considered identical if their structure and nodes are the same.

Examples

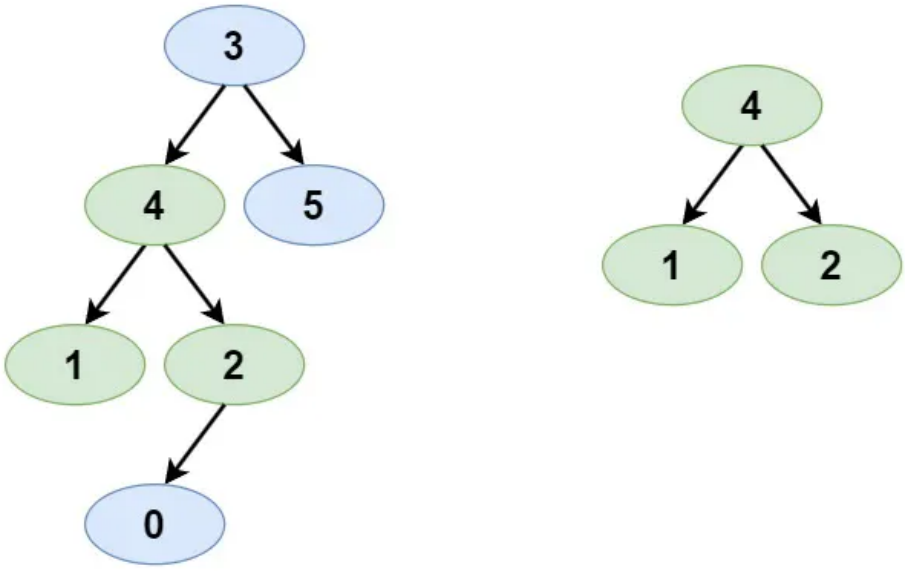

1. - **Input**:
     - Tree `s`: [3,4,5,1,2]
     - Tree `t`: [4,1,2]
   - **Expected Output**: true
   - **Justification**: Tree `t` can be found as a subtree of `s` rooted at the node with value 4.

2. - **Input**:
     - Tree `s`: [1,2,3]
     - Tree `t`: [2,3]
   - **Expected Output**: false
   - **Justification**: There's no subtree in `s` that looks like tree `t`.

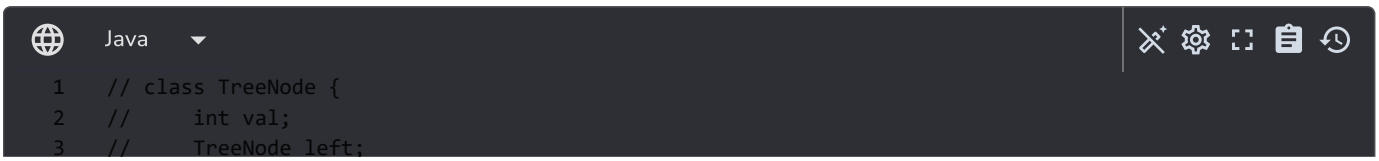

3.
   - **Input**:
     - Tree `s`: [3,4,5,1,2,null,null,null,null,0]
     - Tree `t`: [4,1,2]
   - **Expected Output**: false
   - **Justification**: Even though there's a subtree with root 4, it's not identical to tree `t`.

Try it yourself

Try solving this question here:

```
4   //     TreeNode right;
5
6   //     TreeNode() {}
7
8   //     TreeNode(int val) { this.val = val; }
9
10  //     TreeNode(int val, TreeNode left, TreeNode right) {
11  //         this.val = val;
12  //         this.left = left;
13  //         this.right = right;
14  //     }
15  // }
16
17  public class Solution {
18      public boolean isSubtree(TreeNode s, TreeNode t) {
19          // ToDo: Write Your Code Here.
20          return false;
21      }
22  }
23
```

Test Case | Run Code Result | Stdout

```
[3,4,5,1,2]
[4,1,2]
```

Use Example Testcases | Run | Submit
