Problem 1: Find if Path Exists in Graph(easy)

Problem Statement

Given an undirected graph, represented as a list of edges. Each edge is illustrated as a pair of integers `[u, v]`, signifying that there's a mutual connection between node `u` and node `v`.

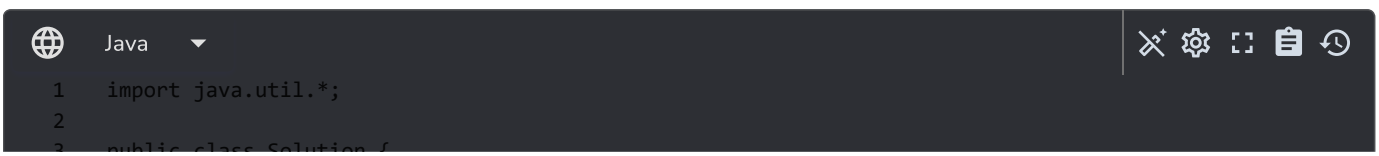

Given this graph, a starting node `start`, and a destination node `end`, your task is to ascertain if a path exists between the starting node and the destination node.

Examples

1. **Example 1**:
   - Input: `4, [[0,1],[1,2],[2,3]], 0, 3`
   - Expected Output: `true`
   - Justification: There's a path from node 0 -> 1 -> 2 -> 3.
2. **Example 2**:
   - Input: `4, [[0,1],[2,3]], 0, 3`
   - Expected Output: `false`
   - Justification: Nodes 0 and 3 are not connected, so no path exists between them.
3. **Example 3**:
   - Input: `5, [[0,1],[3,4]], 0, 4`
   - Expected Output: `false`
   - Justification: Nodes 0 and 4 are not connected in any manner.

Try it yourself

Try solving this question here:

```
    public class Solution {
        private boolean[] visited; // To keep track of visited nodes

        public boolean validPath(int n, int[][] edges, int start, int end) {
            // ToDo: Write Your Code Here.
            return false;
        }

    }

```

Test Case | Run Code Result | Stdout

```
3
[[0,1],[1,2],[2,0]]
0
2
```

Use Example Testcases | Run | Submit
