Problem Challenge 1: Next Interval (hard)

Problem Statement

Given an array of intervals, find the next interval of each interval. In a list of intervals, for an interval ‘i’ its next interval ‘j’ will have the smallest ‘start’ greater than or equal to the ‘end’ of ‘i’.

Write a function to return an array containing indices of the next interval of each input interval. If there is no next interval of a given interval, return -1. It is given that none of the intervals have the same start point.

Example 1:

```
Input: Intervals [[2,3], [3,4], [5,6]]
Output: [1, 2, -1]
Explanation: The next interval of [2,3] is [3,4] having index ‘1’. Similarly, the
next interval of [3,4] is [5,6] having index ‘2’. There is no next interval for
[5,6] hence we have ‘-1’.
```

Example 2:

```
Input: Intervals [[3,4], [1,5], [4,6]]
Output: [2, -1, -1]
Explanation: The next interval of [3,4] is [4,6] which has index ‘2’. There is no
next interval for [1,5] and [4,6].
```

Try it yourself

Try solving this question here:

Java

```
import java.util.*;

/*class Interval {
  int start = 0;
  int end = 0;

  Interval(int start, int end) {
    this.start = start;
    this.end = end;
  }
}*/

```

```
13   class Solution {
14     public static int[] findNextInterval(Interval[] intervals) {
15       int n = intervals.length;
16       int[] result = new int[n];
17
18       return result;
19     }
20   }
21
```

Test Case | Run Code Result | Stdout

```
[[2, 3], [3, 4], [5, 6]]
```

Use Example Testcases | Run | Submit
