Problem Challenge 2: Structurally Unique Binary Search Trees (hard)

Problem Statement

Given a number ‘n’, write a function to return all structurally unique Binary Search Trees (BST) that can store values 1 to ‘n’?

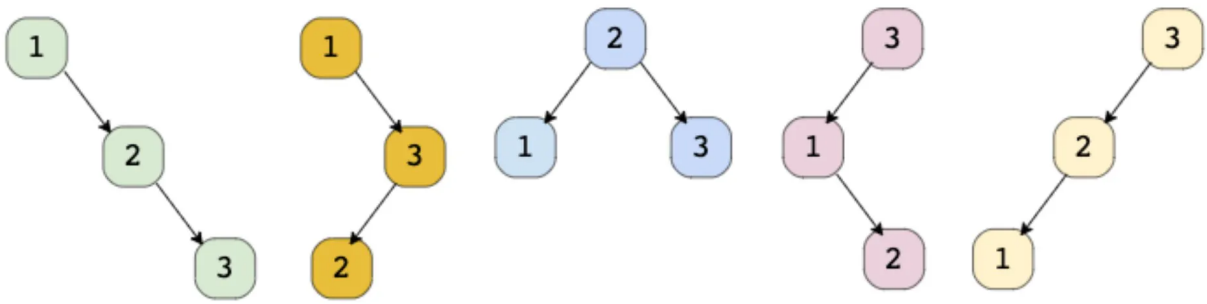

Example 1:

```
Input: 2
Output: List containing root nodes of all structurally unique BSTs.
Explanation: Here are the 2 structurally unique BSTs storing all numbers from 1 to
2:
```

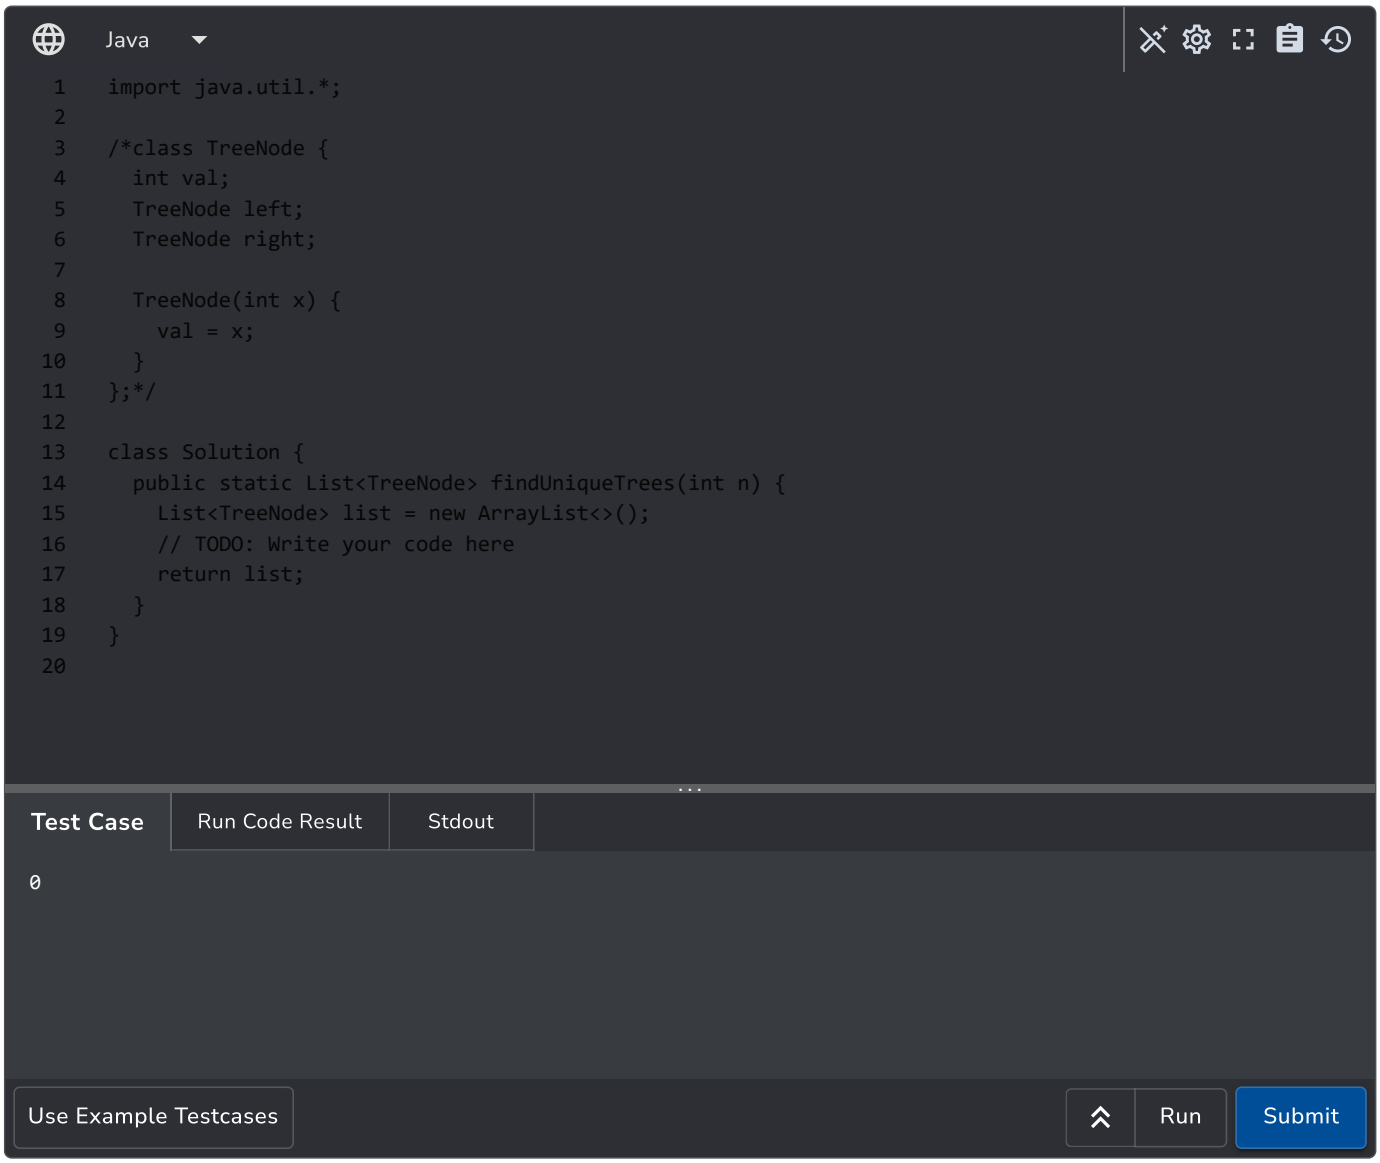

Example 2:

```
Input: 3
Output: List containing root nodes of all structurally unique BSTs.
Explanation: Here are the 5 structurally unique BSTs storing all numbers from 1 to
3:
```
