Problem Challenge 2: String Anagrams (hard)

Problem Statement

Given a string and a pattern, find **all anagrams of the pattern in the given string.**

Every **anagram** is a **permutation** of a string. As we know, when we are not allowed to repeat characters while finding permutations of a string, we get *N*! permutations (or anagrams) of a string having N*N* characters. For example, here are the six anagrams of the string “abc”:

1. abc
2. acb
3. bac
4. bca
5. cab
6. cba

Write a function to return a list of starting indices of the anagrams of the pattern in the given string.

Example 1:

```
Input: String="ppqp", Pattern="pq"
Output: [1, 2]
Explanation: The two anagrams of the pattern in the given string are "pq" and "qp".
```

Example 2:

```
Input: String="abbcabc", Pattern="abc"
Output: [2, 3, 4]
Explanation: The three anagrams of the pattern in the given string are "bca", "cab"
, and "abc".
```

Try it yourself

Try solving this question here:

```
3
4   class Solution {
5       public List<Integer> findStringAnagrams(String str, String pattern) {
6         List<Integer> resultIndices = new ArrayList<Integer>();
7         // TODO: Write your code here
8         return resultIndices;
9     }
10  }
11
```

Test Case | Run Code Result | Stdout

```
"ppqp"
"pq"
```

Use Example Testcases | Run | Submit
