0/1 Knapsack

Problem Statement

Given two integer arrays to represent weights and profits of 'N' items, we need to find a subset of these items which will give us maximum profit such that their cumulative weight is not more than a given number 'C'. Write a function that returns the maximum profit. Each item can only be selected once, which means either we put an item in the knapsack or skip it.

Try it yourself

Try solving this question here:

Java

```java
public class Solution {
  public int solveKnapsack(int[] profits, int[] weights, int capacity) {
    // TODO: Write your code here
    return -1;
  }
}

```

Test Case | Run Code Result | Stdout

```
[1,6,10,16]
[1,2,3,5]
7
```
