Staircase

Problem Statement

Given a stair with 'n' steps, implement a method to count how many possible ways are there to reach the top of the staircase, given that, at every step you can either take 1 step, 2 steps, or 3 steps.

Example 1:

```
Number of stairs (n) : 3
Number of ways = 4
Explanation: Following are the four ways we can climb : {1,1,1}, {1,2}, {2,1}, {3}
```

Example 2:

```
Number of stairs (n) : 4
Number of ways = 7
Explanation: Following are the seven ways we can climb : {1,1,1,1}, {1,1,2},
{1,2,1}, {2,1,1},
{2,2}, {1,3}, {3,1}
```

Let's first start with a recursive brute-force solution.

Try it yourself

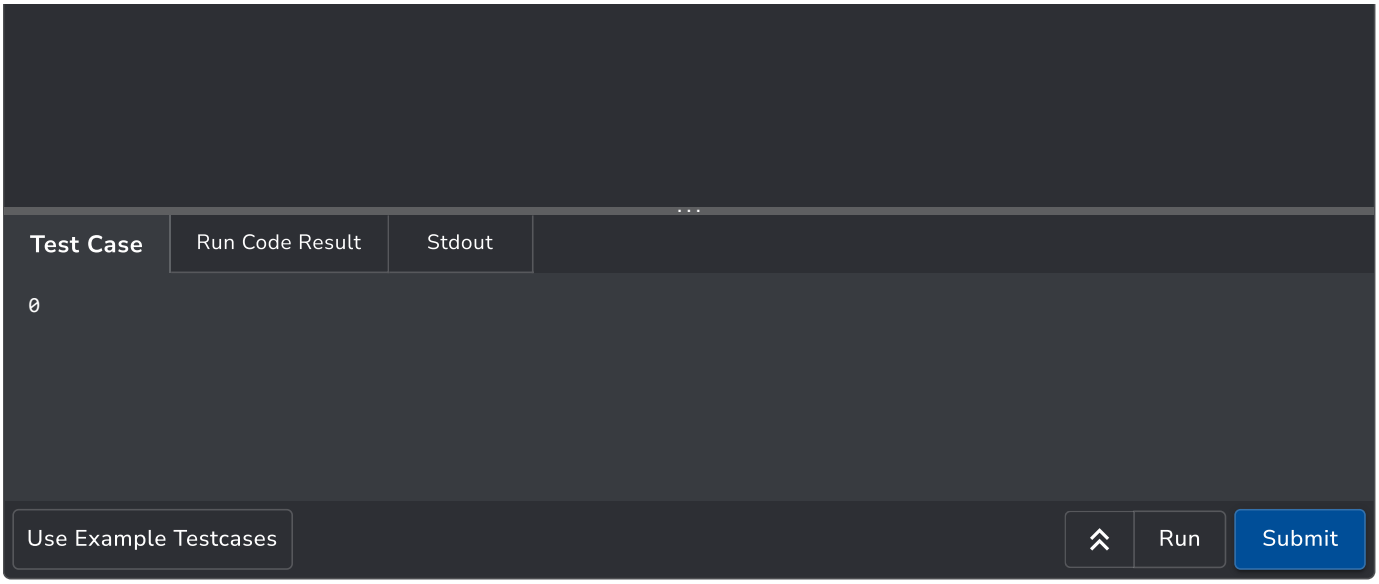

Try solving this question here:

Java

```
class Solution {

  public int countWays(int n) {
    // TODO: Write your code here
    return -1;
  }
}

```
