Minimum jumps with fee

Problem Statement

Given a staircase with ‘n’ steps and an array of 'n' numbers representing the fee that you have to pay if you take the step. Implement a method to calculate the minimum fee required to reach the top of the staircase (beyond the top-most step). At every step, you have an option to take either 1 step, 2 steps, or 3 steps. You should assume that you are standing at the first step.

Example 1:

```
Number of stairs (n) : 6
Fee: {1,2,5,2,1,2}
Output: 3
Explanation: Starting from index '0', we can reach the top through: 0->3->top
The total fee we have to pay will be (1+2).
```

Example 2:

```
Number of stairs (n): 4
Fee: {2,3,4,5}
Output: 5
Explanation: Starting from index '0', we can reach the top through: 0->1->top
The total fee we have to pay will be (2+3).
```

Try it yourself

Try solving this question here:

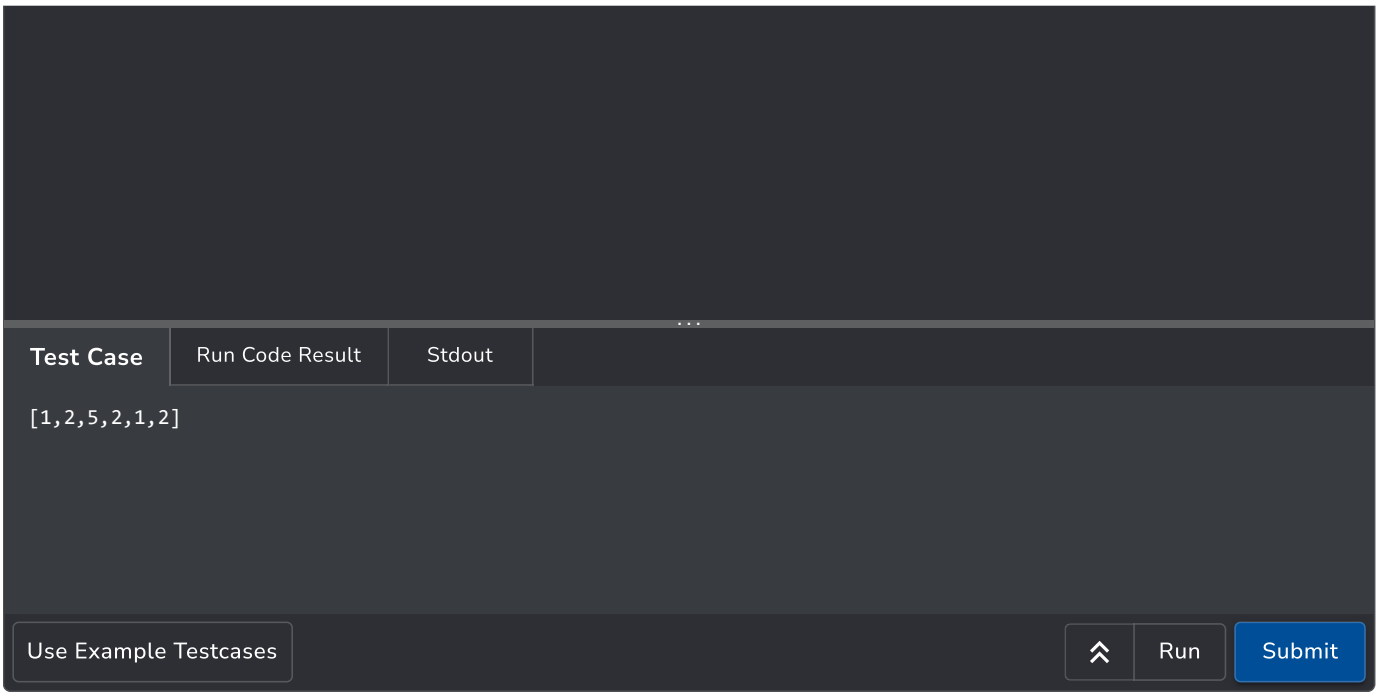

Java

```
class Solution {

  public int findMinFee(int[] fee) {
    // TODO: Write your code here
    return -1;
  }

}

```
