Palindrome Permutation (easy)

Problem Statement

Given a string `s`, return `true` if any permutation of the given string `s` can form a palindromic string. Otherwise, return `false`.

A palindrome is a word, phrase, number, or other sequences of characters that reads the same forward and backward (ignoring spaces, punctuation, and capitalization).

Examples

- **Example 1**:
  - **Input**: `"tactcoa"`
  - **Expected Output**: `true`
  - **Justification**: The string can be rearranged to form "tacocat", which is a palindrome.
- **Example 2**:
  - **Input**: `"abcde"`
  - **Expected Output**: `false`
  - **Justification**: There is no possible rearrangement of these characters that would result in a palindrome.
- **Example 3**:
  - **Input**: `"aabbccdd"`
  - **Expected Output**: `true`
  - **Justification**: The string can be rearranged as "abcddcba", which is palindromes.

Try it yourself

Try solving this question here:

Java

```java
import java.util.HashMap;

public class Solution {
    // Method to check if a permutation of the string can form a palindrome
    public boolean canPermutePalindrome(String s) {
        // ToDo: Write Your Code Here.
        return false;
    }
}

```

Test Case | Run Code Result | Stdout

"tactcoa"

Use Example Testcases | Run | Submit
