Sliding Window Median (hard)

Problem Statement

Given an array of numbers and a number ‘k’, find the median of all the ‘k’ sized sub-arrays (or windows) of the array.

Example 1:

Input: nums=[1, 2, -1, 3, 5], k = 2
Output: [1.5, 0.5, 1.0, 4.0]
Explanation: Let's consider all windows of size ‘2’:

[**1, 2**, -1, 3, 5] -> median is 1.5
[1, **2, -1**, 3, 5] -> median is 0.5
[1, 2, **-1, 3**, 5] -> median is 1.0
[1, 2, -1, **3, 5**] -> median is 4.0

Example 2:

Input: nums=[1, 2, -1, 3, 5], k = 3
Output: [1.0, 2.0, 3.0]
Explanation: Let's consider all windows of size ‘3’:

[**1, 2, -1**, 3, 5] -> median is 1.0
[1, **2, -1, 3**, 5] -> median is 2.0
[1, 2, **-1, 3, 5**] -> median is 3.0

Try it yourself

Try solving this question here:

Java

```
import java.util.*;

class Solution {
  public double[] findSlidingWindowMedian(int[] nums, int k) {
    double[] result = new double[nums.length - k + 1];
    // TODO: Write your code here
```

```
7         return result;
8       }
9
10    }
11
```

Test Case | Run Code Result | Stdout

```
[1, 2, -1, 3, 5]
2
```

Use Example Testcases | Run | Submit
