Kth Largest Number in a Stream (medium)

Problem Statement

Design a class to efficiently find the Kth largest element in a stream of numbers.

The class should have the following two things:

1. The constructor of the class should accept an integer array containing initial numbers from the stream and an integer 'K'.
2. The class should expose a function `add(int num)` which will store the given number and return the Kth largest number.

Example 1:

```
Input: [3, 1, 5, 12, 2, 11], K = 4
1. Calling add(6) should return '5'.
2. Calling add(13) should return '6'.
2. Calling add(4) should still return '6'.
```

Try it yourself

Try solving this question here:

Java

```java
import java.util.*;

class Solution {
  public Solution(int[] nums, int k) {
    // TODO: Write your code here
  }

  public int add(int num) {
    // TODO: Write your code here
    return num;
  }
}
```

Test Case | Run Code Result | Stdout

```
[3, 1, 5, 12, 2, 11]
4
6
```

Use Example Testcases | Run | Submit
