Extra Characters in a String (medium)

Problem Statement

Given a string `s` and an array of words `words`. Break string `s` into multiple non-overlapping substrings such that each substring should be part of the `words`. There are some characters left which are not part of any substring.

Return the minimum number of remaining characters in `s`, which are not part of any substring after string break-up.

Examples

1. **Example 1**:
   - **Input**: `s = "amazingracecar"`, `words = ["race", "car"]`
   - **Expected Output**: `7`
   - **Justification**: The string `s` can be rearranged to form "racecar", leaving 'a', 'm', 'a', 'z', 'i', 'n', 'g' as extra.
2. **Example 2**:
   - **Input**: `s = "bookkeeperreading"`, `words = ["keep", "read"]`
   - **Expected Output**: `9`
   - **Justification**: The words "keep" and "read" can be formed from `s`, but 'b', 'o', 'o', 'k', 'e', 'r', 'i', 'n', 'g' are extra.
3. **Example 3**:
   - **Input**: `s = "thedogbarksatnight"`, `words = ["dog", "bark", "night"]`
   - **Expected Output**: `6`
   - **Justification**: The words "dog", "bark", and "night" can be formed, leaving 't', 'h', 'e', 's', 'a', 't' as extra characters.

Try it yourself

Try solving this question here:

Java

```java
// class TrieNode {
//     TrieNode[] children = new TrieNode[26];  // Representing each character of the alphabet.
//     boolean isEnd = false;  // To determine if the current TrieNode marks the end of a word.
// }

class Solution {

    // Method to calculate minimum extra characters.
    public int minExtraChar(String str, String[] dictionary) {
        // ToDo: Write Your Code Here.
        return 0;  // Minimum extra characters for the entire string.
    }
}

```

Test Case | Run Code Result | Stdout

```
"sayhelloworld"
["hello", "world"]
```

Use Example Testcases | Run | Submit
