Largest Palindromic Number (Medium)

Problem Statement

Given a string `s` containing 0 to 9 digits, create the largest possible palindromic number using the string characters.

A palindromic number reads the same backward as forward.

If it's not possible to form such a number using all digits of the given string, you can skip some of them.

Examples

1.
   - **Input**: "323211444"
   - **Expected Output**: "432141234"
   - **Justification**: This is the largest palindromic number that can be formed from the given digits.
2.
   - **Input**: "998877"
   - **Expected Output**: "987789"
   - **Justification**: "987789" is the largest palindrome that can be formed.
3.
   - **Input**: "54321"
   - **Expected Output**: "5"
   - **Justification**: Only "5" can form a valid palindromic number as other digits cannot be paired.

Try it yourself

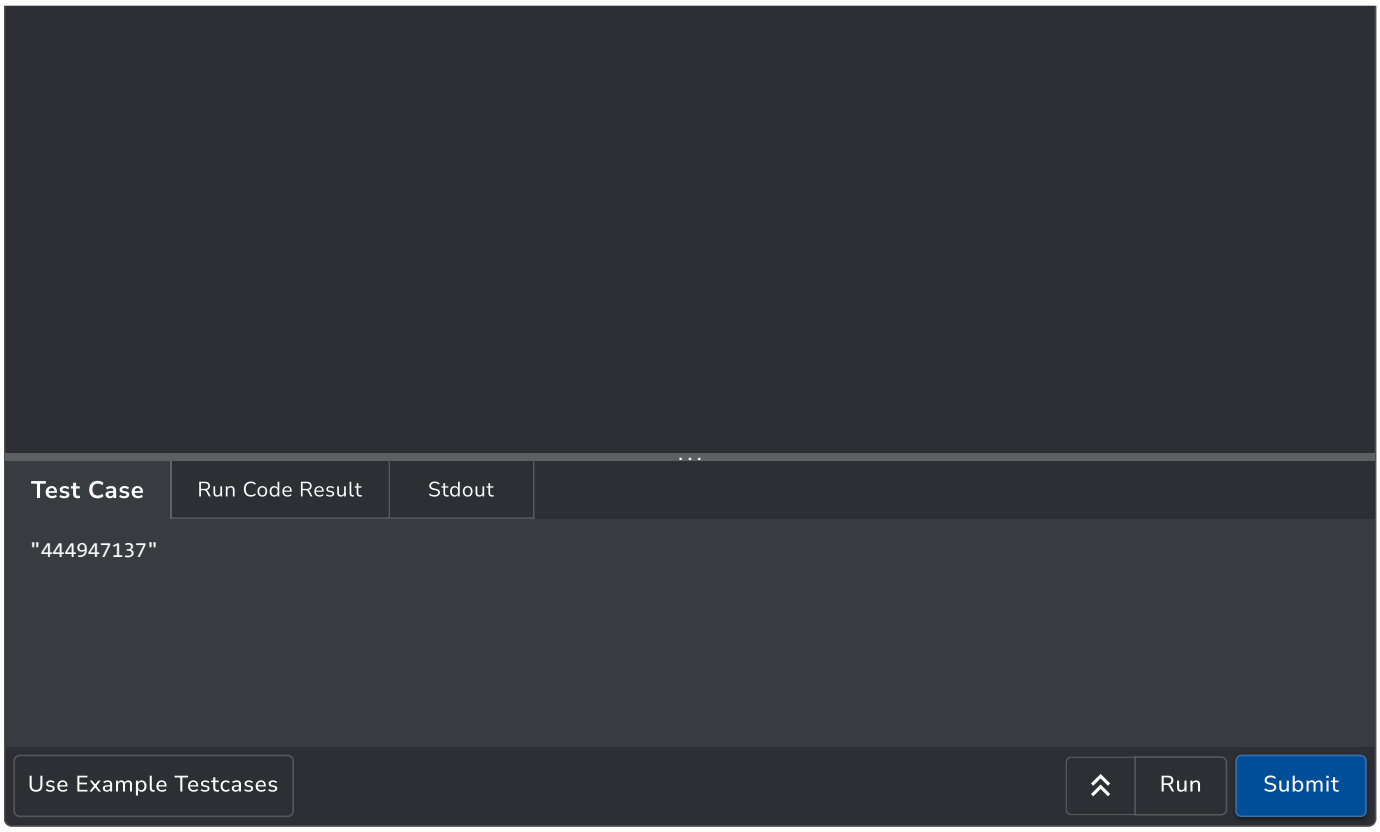

Try solving this question here:

Java

```java
import java.util.Arrays; // Import Arrays class

public class Solution {
    public String largestPalindromic(String num) {
        // ToDo: Write Your Code Here.
        return "";
    }
}

```
