Shortest Word Distance (easy)

Problem Statement

Given an array of strings `words` and two different strings that already exist in the array `word1` and `word2`, return the shortest distance between these two words in the list.

Example 1:

```
Input: words = ["the", "quick", "brown", "fox", "jumps", "over", "the", "lazy", "dog"], word1 = "fox", word2 = "dog"
Output: 5
Explanation: The distance between "fox" and "dog" is 5 words.
```

Example 2:

```
Input: words = ["a", "c", "d", "b", "a"], word1 = "a", word2 = "b"
Output: 1
Explanation: The shortest distance between "a" and "b" is 1 word. Please note that "a" appeared twice.
```

Example 3:

```
Input: words = ["a", "b", "c", "d", "e"], word1 = "a", word2 = "e"
Output: 4
Explanation: The distance between "a" and "e" is 4 words.
```

Try it yourself

Try solving this question here:

Java

```
1  class Solution {
2    public int shortestDistance(String[] words, String word1, String word2) {
3      // TODO: Write your code here
4      return 1;
5    }
6  }
7
```

Test Case | Run Code Result | Stdout

```
["the","quick","brown","fox","jumps","over","the","lazy","dog"]
"fox"
"dog"
```

Use Example Testcases | Run | Submit
