Sqrt (medium)

Problem Statement

Given a non-negative integer `x`, return the square root of `x` rounded down to the nearest integer. The returned integer should be non-negative as well.

You **must not use** any built-in exponent function or operator.

For example, do not use `pow(x, 0.5)` in c++ or `x ** 0.5` in python.

Example 1:

```
Input: x = 8
Output: 2
Explanation: The square root of 8 is 2.8284, and since we need to return the floor
of the square root (integer), hence we returned 2.
```

Example 2:

```
Input: x = 4
Output: 2
Explanation: The square root of 4 is 2.
```

Example 3:

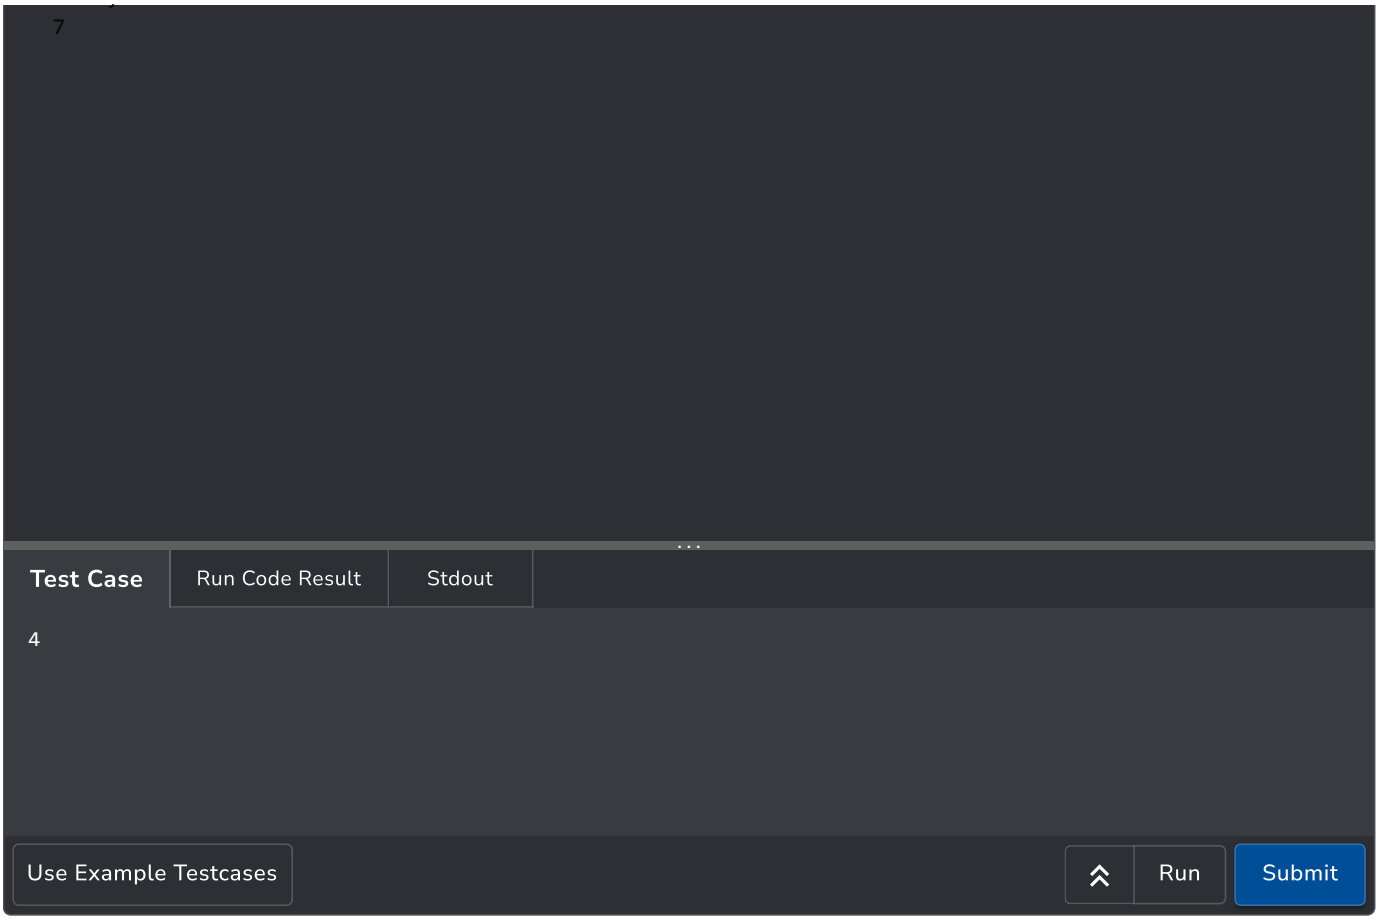

```
Input: x = 2
Output: 1
Explanation: The square root of 2 is 1.414, and since we need to return the floor
of the square root (integer), hence we returned 1.
```

Try it yourself

Try solving this question here:

Java

```java
class Solution {
  public int mySqrt(int x) {
    // TODO: Write your code here
    return 0;
  }
}
```

For a detailed solution, see the next chapter.
