Reverse Words in a String II

Problem Statement

Given a character array `s`, return the updated array after reversing the order of `words` in the array.

A word is defined as a sequence of `non-space characters`, and the words are separated by `one space` character. The input array does not contain any leading or trailing spaces, and the words are always separated by a `single space`.

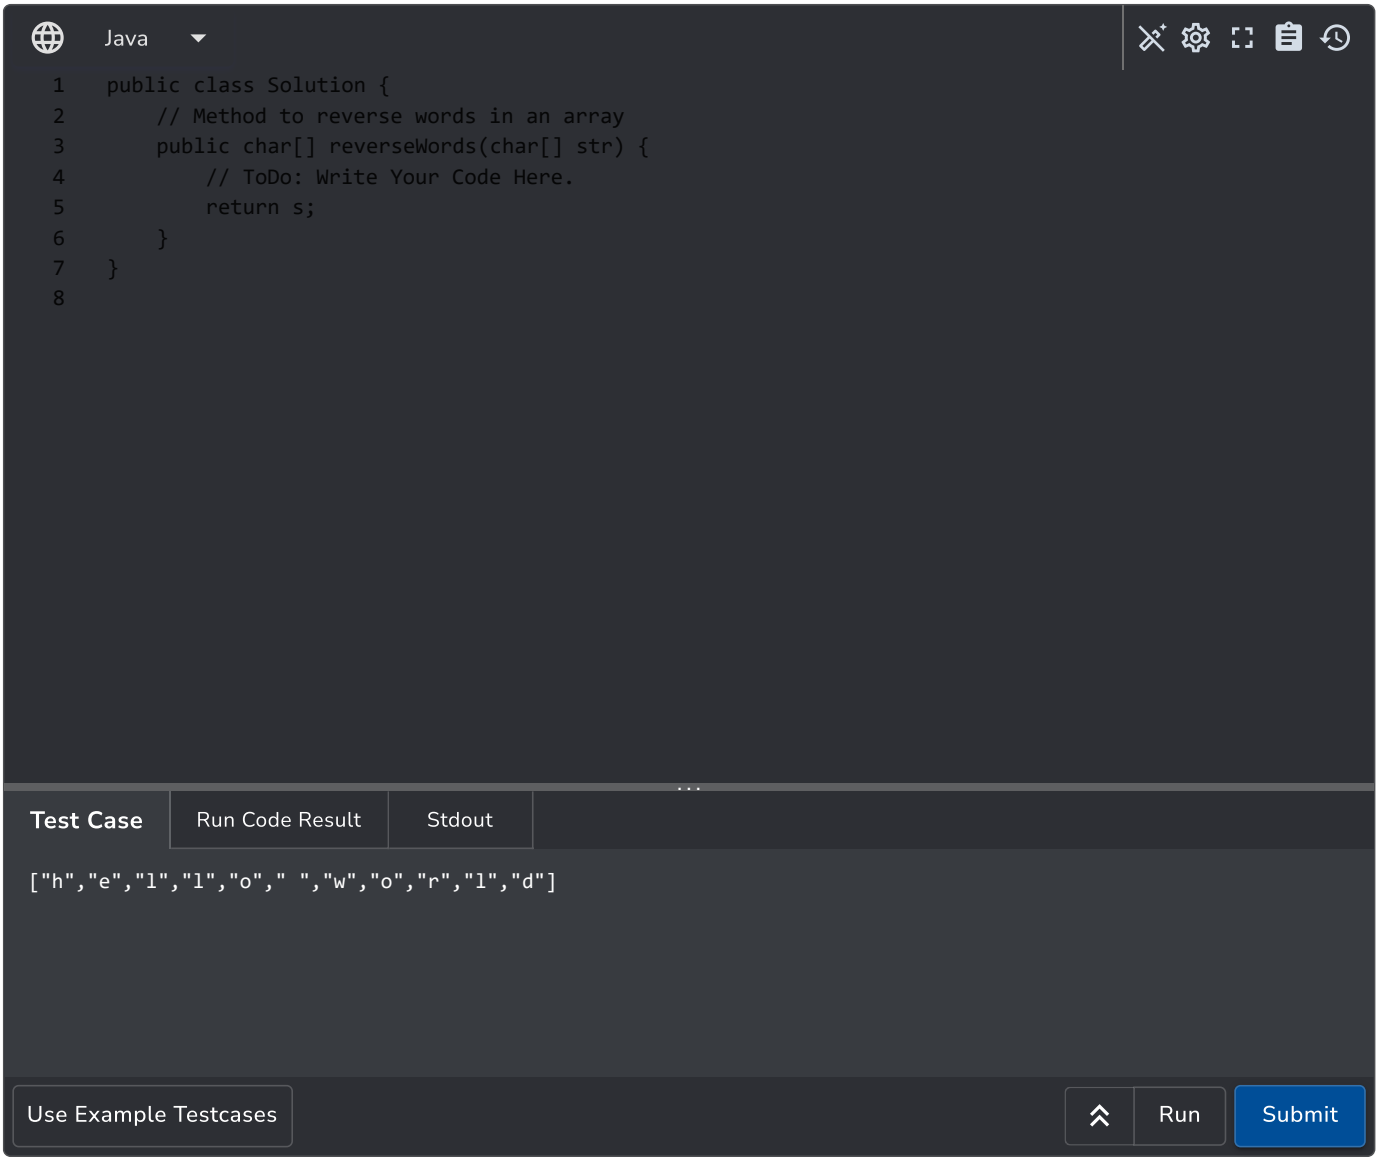

Note: Your code must solve the problem without using any extra space.

Examples

- **Example 1**:
  - **Input**: `["h","e","l","l","o"," ","w","o","r","l","d"]`
  - **Expected Output**: `["w","o","r","l","d"," ","h","e","l","l","o"]`
  - **Justification**: The original string is "hello world". Reversing the words gives "world hello".
- **Example 2**:
  - **Input**: `["m","o","r","n","i","n","g"," ","s","k","y"," ","i","s"," ","b","r","i","g","h","t"]`
  - **Expected Output**: `["b","r","i","g","h","t"," ","i","s"," ","s","k","y"," ","m","o","r","n","i","n","g"]`
  - **Justification**: The original string is "morning sky is bright". Reversing the words gives "bright is sky morning".
- **Example 3**:
  - **Input**: `["a","l","o","n","e"]`
  - **Expected Output**: `["a","l","o","n","e"]`
  - **Justification**: There's only one word "alone", so the reverse is the same as the original.
