Median of Two Sorted Arrays (hard)

Problem Statement

Given two sorted arrays, `nums1` and `nums2` of different sizes in the ascending order, return the median of two sorted arrays after merging them.

The median is the middle value in an ordered set, or the average of the two middle values if the set has an even number of elements.

Examples

1. **Example 1**:
   - **Input**: `[1, 3, 5]` and `[2, 4, 6]`
   - **Expected Output**: `3.5`
   - **Justification**: When merged, the array becomes `[1, 2, 3, 4, 5, 6]`. The median is the average of the middle two values, `(3 + 4) / 2 = 3.5`.
2. **Example 2**:
   - **Input**: `[1, 1, 1]` and `[2, 2, 2]`
   - **Expected Output**: `1.5`
   - **Justification**: The merged array is `[1, 1, 1, 2, 2, 2]`. The median is `(1 + 2) / 2 = 1.5`.
3. **Example 3**:
   - **Input**: `[2, 3, 5, 8]` and `[1, 4, 6, 7, 9]`
   - **Expected Output**: `5`
   - **Justification**: The merged array would be `[10, 15, 20, 25, 30, 35, 40, 45]`. The median is the average of the middle two values, `25` and `30`, which is `(25 + 30) / 2 = 27.5`.

Try it yourself

Try solving this question here:

Java

```java
public class Solution {

    // Function to find the median of two sorted arrays
    public double findMedianSortedArrays(int[] nums1, int[] nums2) {
        // ToDO: Write Your Code Here.
        return 0;
    }
}

```

Test Case | Run Code Result | Stdout

```
[1, 2]
[3, 4]
```

Use Example Testcases | Run | Submit
