Problem Challenge 1: Permutation in a String (hard)

Problem Statement

Given a string and a pattern, find out if the **string contains any permutation of the pattern.**

Permutation is defined as the re-arranging of the characters of the string. For example, “abc” has the following six permutations:

1. abc
2. acb
3. bac
4. bca
5. cab
6. cba

If a string has ‘n’ distinct characters, it will have *n*! permutations.

Example 1:

```
Input: String="oidbcaf", Pattern="ABC"
Output: true
Explanation: The string contains "bca" which is a permutation of the giv
en pattern.
```

Example 2:

```
Input: String="odicf", Pattern="dc"
Output: false
Explanation: No permutation of the pattern is present in the given strin
g as a substring.
```

Example 3:

```
Input: String="bcdxabcdy", Pattern="bcdyabcdx"
Output: true
Explanation: Both the string and the pattern are a permutation of each o
ther.
```

Example 4:

```
Input: String="aaacb", Pattern="abc"
Output: true
Explanation: The string contains "acb" which is a permutation of the giv
en pattern.
```

Try it yourself

Try solving this question here:

Java

```java
import java.util.*;

class Solution {
  public boolean findPermutation(String str, String pattern) {
    // TODO: Write your code here
    return false;
  }
}
```

Test Case | Run Code Result | Stdout

```
"oidbcaf"
"abc"
```

Use Example Testcases | Run | Submit
